- The customer goes to the order page and there will be a menu list displayed on this page for customers to choose the food.
- The customer selects the food and clicks the 'confirm order' button to confirm their order.
- The staff confirms the order and the system checks for its availability in the system database.
- If the order is available, the customer will be notified and lead to the payment page. On this page, customers can choose payment by cash or by credit card. If the customer pays for the order by credit card, they must fill in their credit card's information, and the banking system checks for the balance. If the balance is enough for payment, the banking system updates the order payment status as well as records the transaction in the system database and the payment page notifies this to the customer. Otherwise, there will be a notification to the customer that there is some failure in the payment process.
- If the order is not available, the order page sends a notification to the customer.
